CHRONOBIOLOGY INTERNATIONAL, 14(6), 655–660 (1996)

Subject Index to Volume 14

A

Aging
  and differences of blood pressure profile in essential hypertension, 397–407
  effect on the free-running period in mice, 19–23
  physiological and pathological brain, changes in endocrine circadian rhythms as markers of, 385–396
Alertness three-process model, extension to performance, sleep latency, and sleep length, 115–123
Alertness-enhancing drugs, as a countermeasure to fatigue in irregular work hours, 145–158
Ambulatory blood pressure monitoring, for variability in the period of the blood pressure circadian rhythm in humans, 307–317
Aspirin usage, influence on blood pressure, 619–637
Asthma, in children
  heart rate variability during 24 hours, 597–606
  relationship between within-day bronchial variability and bronchial responsiveness in, 61–69
Autonomic nervous function, measurement by 24-hour heart rate variability in asthmatic children, 597–606

B

Bilirubin, role in the regulation of REM sleep and in mediating light's antidepressant effects, 319–329
Biological oscillators, modeling temperature compensation in, 499–510
Biological rhythms, physiology and pharmacology of (book review), 331–332
Blood pressure
  circadian rhythm, in humans, variability in the period of, 307–317
  influence of aspirin usage on, 619–637
  profile, in essential hypertension, age-related differences of, 397–407
Blowfly *Lucilia cuprina*, photoperiodic control of larval burrowing in, 247–252
Bone marrow, circannual variation of cell proliferation in, 347–362
Brain aging, physiological and pathological, changes in endocrine circadian rhythms as markers of, 385–396
Bright light, as a countermeasure for jet lag, 173–183
Bronchial variability, relationship to bronchial responsiveness in asthmatic children, 61–69

C

Chaos, in organisms, 531–536
Chemical oscillators, modeling temperature compensation in, 499–510
Chronotherapy, with diltiazem for patients with essential hypertension, 71–84
Circadian rhythms
  of blood pressure
    age-related differences in essential hypertension, 397–407
    variability in the period of, 307–317
  and chaos, 531–536
  of core temperature and salivary immunoglobulin A, effects of clothing type on, 607–617
  dependence of degree of entrainment on the number of oscillators, 9–18
  disorders, melatonin as a treatment for, 185–204
  the effect of aging on the free-running period, 19–23
  endocrine, changes as markers of physiological and pathological brain aging, 385–396

logical and pathological brain aging, (*contd.*)
and exercise, 221–229
of growth hormone secretion, 49–60
in the hypothermic response to serotonin$_{1A}$ receptor agonist 8-OH-DPAT in rats, 267–273
influence of melatonin on, 205–220
locomotor, nonparametric effects of monochromatic light on, 25–34
mammalian, rapid phase resetting by brief light pulses, 537–548
measurement after time-zone transitions and during night work, 125–132
reactivity, of rat gastric mucosa to restraint-cold stress and indomethacin, 575–583
of serum melatonin, central suppression of fluctuations by vitamin B_{12}, 549–560
and temperature compensation
based on dimerization of the PER protein, 521–529
control of the period for circadian oscillations of the PER protein in *Drosophila*, 511–520
link with membrane composition in *Neurospora crassa*, 445–454
molecular mechanisms of, 455–468
of their period, 469–479, 481–498
in the torque developed by elbow flexors during isometric contraction, 287–294
of the ventricular fibrillation threshold during normal and hypoventilation in rats, 363–370
Circalunidian clock, versus circatidal clock, 337–346, 427–430, 431–433, 435–437
Circannual rhythm, of cell proliferation in lymphoid organs and bone marrow of mice on three lighting regimens, 347–362
Circatidal clock, versus circalunidian clock, 337–346, 427–430, 431–433, 435–437
Clothing type, effects on the day-night variation of core temperature and salivary immunoglobulin A, 607–617
Core temperature, effects of clothing type on the day-night variation of, 607–617
Crayfish
nonparametric effects of monochromatic light on the activity rhythm of, 25–34
relationship between free-running period and minimum tolerable light pulse interval of skeleton photoperiods of, 237–245
seasonal rhythm of red pigment concentrating hormone in, 639–645
Cyclosporin A, dosing-timedependent influence of chronic treatment on daily profiles of plasma glucose and insulin in the rat, 275–285

D

Daily life-style regularity, differences over the life span, 295–306
Daily rhythm, of plasma glucose and insulin in the rat, dosing-timedependent influence of chronic cyclosporin A treatment on, 275–285
Diltiazem, administration-time-dependent effects on the 24-hour blood pressure profile of essential hypertension patients, 71–84
Diurnal rhythms
in psychophysiological variables in children, 371–384
of visual sensitivity in humans, 35–48
DQ-FIT, for analysis of telemetric time series data for periodic components, 561–574
Drugs, alertness-enhancing, as a countermeasure to fatigue in irregular work hours, 145–158

E

Elbow flexion, circadian rhythm in the torque developed during isometric contractions, 287–294
Endocrine circadian rhythm changes, as markers of physiological and pathological brain aging, 385–396
Entrainment
of the circadiun rhythm of locomotor activity in mice, for examination of the relationship between the free-running period and minimum tolerable light pulse interval of the skeleton photoperiods, 237–245

simultaneous presence with masking and free-running rhythm, 9–18
Eukaryotic microbes, homeostasis of the period of the ultradian clocks of, 469–479
Exercise
and biological rhythms (book review), 647–648
and human circadian rhythms, 221–229

F

Free-running
period
effect of aging on, 19–23
relationship with minimum tolerable light pulse interval of skeleton photoperiods in mice, 237–245
rhythm, simultaneous presence with entrainment and masking, 9–18
Freund's adjuvant, 24-hour rhythms of serum ACTH, prolactin, growth hormone, and thyroid-stimulating hormone, and of median-eminence norepinephrine, dopamine, and serotonin in rats injected with, 253–265

G

Gene expression, temperature compensation of the circadian period length as a special case of the general homeostatic mechanisms of, 481–498
Glucose daily profiles, plasma, the dosing-timedependent influence of chronic cyclosporin A treatment on, 275–285
Goodwin model, for temperature compensation in chemical and biological oscillators, 499–510
Growth hormone
plasma, time-specified tolerance intervals for hybrid time series with nonequidistant sampling for, 409–425
secretory rates, in night workers, 49–60
Gymnastic time, influence on diurnal patterns, 371–384

H

Health problems, associated with shiftwork, 89–98
Heart rate variability, during 24 hours in asthmatic children, 597–606
8-Hydroxy-2-(di-*n*-propylamino)tetralin (8-OH-DPAT), circadian rhythm in the hypothermic response to, 267–273
Hypertension
essential
administration-time-dependent effects of diltiazem on the 24-hour blood pressure profile of patients with, 71–84
age-related differences of blood pressure profile in, 397–407
mild, influence of aspirin usage on blood pressure in, 619–637
Hypnotics, and promotion of sleep for shiftworkers and intercontinental travelers, 133–143
Hypothermia, in response to serotonin$_{1A}$ receptor agonist 8-OH-DPAT in rats, circadian rhythm of, 267–273
Hypoventilation, 24-hour rhythm of the ventricular fibrillation threshold during, 363–370

I

Immune-mediated inflammatory response, after injection of Freund's adjuvant, 253–265
Immunoglobulin A, salivary, effects of clothing type on the day-night variation of, 607–617
Indomethacin, circadian reactivity rhythm of rat gastric mucosa to, 575–583
Insulin daily profiles, the dosing-timedependent influence of chronic cyclosporin A treatment on, 275–285
Isolation, temporal, effects of illumination intensity on human time perception in, 585–596

J

Jet lag
bright light as a countermeasure for, 173–183
melatonin as a treatment for, 185–204
pertinence of interindividual differences in the flexibility of human temporal organization to, 99–113
sleep promotion for those with, 133–143

L

Larval burrowing, in the blowfly, photoperiodic control of, 247–252
Life-style regularity, daily, differences over the life span, 295–306
Light
  bright, as a countermeasure for jet lag, 173–183
  intensity, effects on human time perception in temporal isolation, 585–596
  monochromatic, nonparametric effects on the activity rhythm of juvenile crayfish, 25–43
  pulse interval
    brief, rapid phase resetting of a mammalian circadian rhythm by, 537–548
    minimum tolerable, relationship with free-running period for skeleton photoperiods of mice, 237–245
Lighting regimens, effect on the circannual variation of cell proliferation in lymphoid organs and bone marrow of mice, 347–362
Locomotor activity rhythm, of juvenile crayfish, nonparametric effects of monochromatic light on, 25–34
Lymphatic organs, circannual variation of cell proliferation in, 347–362

M

Masking
  of circadian rhythms after time-zone transitions and during night work, 125–132
  simultaneous presence with entrainment and free-running rhythm, 9–18
Melatonin
  influence on human circadian rhythms, 205–220
  serum rhythm, suppression of transient fluctuation by vitamin B_{12}, 549–560
  as a treatment for circadian rhythm disorders, 185–204
Membranes
  and circadian rhythms (book review), 439–440
  composition, and temperature compensation in *Neurospora crassa*, 445–454
Mice
  the effect of aging on free-running period in, 19–23
  relationship between free-running period and minimum tolerable light pulse interval of, 237–245
Mollusc, the role of extracellular sodium in the mechanism of a neuronal in vitro circadian pacemaker in, 1–8
Monochromatic light, nonparametric effects on the activity rhythm of juvenile crayfish, 25–34
Moon, biology of (book review), 440–441
Multioscillatory system, as an explanation of the simultaneous presence of free-running, masking, and entrainment, 9–18

N

Naylor hypothesis, for the circatidal/circalunidian clock, 337–346, 427–430, 431–433, 435–437
Neuronal in vitro circadian pacemaker, the role of extracellular sodium in the mechanism of, 1–8
Neurospora crassa, temperature compensation and membrane composition in, 445–454
News and comments, 85–88, 231–236, 333–335, 443–444, 649–650
Night work, measurement of circadian rhythms during, 125–132
Night workers, growth hormone secretion in, 49–60

O

8-OH-DPAT. *See* 8-Hydroxy-2-(di-*n*-propylamino)tetralin
Oscillations, circadian, of the PER protein in *Drosophila*, control of the period in a model for, 511–520
Oscillators, chemical and biological, modeling temperature compensation in, 499–510

P

PER protein
  control of the period in a model for circadian oscillations of, 511–520
  dimerization, for temperature compensa-

tion of the circadian rhythm in *Drosophila*, 521–529
Performance
efficiency problems, associated with shiftwork, 89–98
extension of the three-process model of alertness to, 115–123
Phase response curve, rapid resetting by brief light pulses, 537–548
Photoperiodic control, of larval burrowing in the blowfly, 247–252
Phototransduction, of environmental time cues, 319–329
Psychophysics, for assessment of the diurnal rhythm of visual sensitivity, 35–48
Psychophysiological variables, diurnal and seasonal changes in, 371–384

R

Rapid eye movement (REM) sleep, association with bilirubin, 319–329
Rapid phase resetting, of a mammalian circadian rhythm by brief light pulses, 537–548
Red pigment concentrating hormone, seasonal rhythm in the crayfish, 639–645
REM. *See* Rapid eye movement

S

Seasonal rhythms
in psychophysiological variables in children, 371–384
of red pigment concentrating hormone in the crayfish, 639–645
Serotonin$_{1A}$ receptor agonist 8-OH-DPAT, circadian rhythm in the hypothermic response to, 267–273
Shiftwork
alertness-enhancing drugs as a countermeasure to fatigue from, 145–158
design and implementation of, 159–171
melatonin as a treatment for effects of, 185–204
pertinence of interindividual differences in the flexibility of human temporal organization to, 99–113
problems associated with, 89–98
sleep promotion for workers of, 133–143
Skeleton photoperiod, of mice, relationship between free-running period and minimum tolerable light pulse interval of, 237–245
Sleep
inertia, possible effect on visual detection threshold in humans, 35–48
influence in driving growth hormone secretion in night workers, 49–60
latency and length, application of the three-process model of alertness to, 115–123
problems, associated with shiftwork, 89–98
promotion in shiftworkers and intercontinental travelers, 133–143
REM, association with bilirubin, 319–329
Social problems, associated with shiftwork, 89–98
Sodium, extracellular, role in the mechanism of a neuronal in vitro circadian pacemaker, 1–8
Software, DQ-FIT, for analysis of telemetric time series data for periodic components, 561–574
Stress, restraint and cold, circadian reactivity rhythm of rat gastric mucosa to, 575–583

T

Telemetry, DQ-FIT analysis of time series data for periodic components, 561–574
Temperature compensation
and chaos in circadian rhythm, 531–536
of the circadian period length
control in a model for circadian oscillations of the PER protein in *Drosophila*, 511–520
as a special case among general homeostatic mechanisms of gene expression, 481–498
of the circadian rhythm in *Drosophila*, based on dimerization of the PER protein, 521–529
and membrane composition in *Neurospora crassa*, 445–454
modeling in chemical and biological oscillators, 499–510
molecular mechanisms, 455–468

Temperature compensation (*contd.*)
of ultradian clocks of eukaryotic microbes, 469–479
Temporal organization
and disorganization in organisms, 531–536
human, effects of interindividual differences on jet lag and shiftwork, 99–113
Tidal rhythms, and the Naylor hypothesis, 337–346, 427–430, 431–433, 435–437
Time perception, human, in temporal isolation, effects of illumination intensity on, 585–596
Time series
data, telemetric, DQ-FIT analysis for periodic components, 561–574
hybrid, with nonequidistant sampling, computation of time-specified tolerance intervals for, 409–425
Time-zone transitions
bright light as a countermeasure for jet lag, 173–183
measurement of circadian rhythms after, 125–132
Tolerance intervals, time-specified, computation for hybrid time series with nonequidistant sampling, 409–425
Torque, developed by elbow flexors during isometric contraction, circadian rhythm of, 287–294

U

Ultradian clock, of eukaryotic microbes, homeostasis of the period of, 469–479

V

Ventricular fibrillation threshold, 24-hour rhythm during normal and hypoventilation in rats, 363–370
Visual detection threshold, diurnal rhythmicity of, 35–48
Vitamin B_{12}, for central suppression of transient fluctuation of serum melatonin rhythm, 549–560
